Writing Secure

First rule of computer security: don't buy a computer.

Second rule: if you buy one, don't turn it on.

- Dark Avenger

In general, it is best to assume that the network is filled with malevolent entities that will send in packets designed to have the worst possible effect.

- RFC 1122

A03:2021-Injection

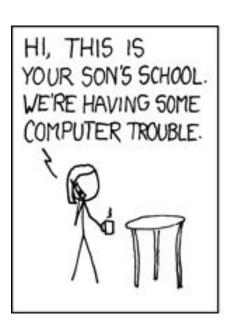

User-supplied data is not validated, filtered, or sanitized by the application.
 Dynamic queries or non-parameterized calls

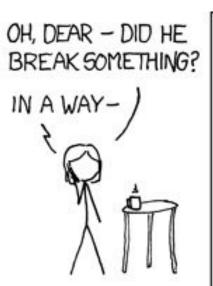

Hostile data is used within object-relational

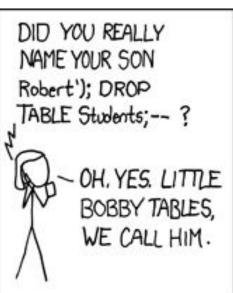

stored procedures.

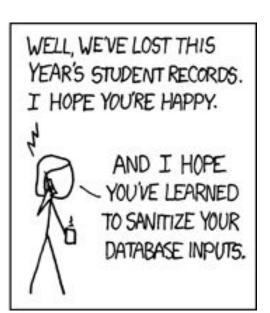

- without context-aware **escaping** are used directly in the interpreter.
- mapping (ORM) search parameters to extract additional, sensitive records.
 Hostile data is directly used or concatenated. The SQL or command contains the structure and malicious data in dynamic queries, commands, or

database/sql

Datensparsamkeit

Datensparsamkeit is a German word that's difficult to translate properly into English. It's an attitude to how we capture and store data, saying that we should only handle data that we really need.

- Martin Fowler

Authentication

A07:2021-Identification and Authentication Failures

Confirmation of the user's identity, authentication, and session management is critical to protect against authentication-related attacks. There may be authentication weaknesses if the application...

- Basic
- Oauth2
- JWT
- OIDC
- ...

If having a coffee in the morning doesn't wake you up, try deleting a table in a production database instead.

- Juozas Kaziukenas

A01:2021-Broken Access Control

Access control enforces policy such that users cannot act outside of their intended permissions. Failures typically lead to unauthorized information disclosure, modification, or destruction of all data or performing a business function outside the user's limits. Common access control vulnerabilities include...

- ACL
- RBAC
- ...

Infrastructure

A05:2021-Security Misconfiguration

- Missing appropriate security hardening ...
- Unnecessary features are enabled or installed (e.g., unnecessary ports, services, pages, accounts, or **privileges**).
- **Default accounts** and their passwords are still enabled and unchanged.
- **Error handling reveals** stack traces or other **overly informative** error messages to users.
- For upgraded systems, the latest security features are disabled or not configured securely.
- The **security settings** in the application servers, application frameworks ... are **not set to secure values**.
- The server does not send **security headers** or directives, or they are not set to secure values.
- The software is **out of date** or vulnerable ...

A09:2021-Security Logging and Monitoring Failures

high-value transactions, are not logged.
 Warnings and errors generate no, inadequate, or unclear log

Auditable events, such as logins, failed logins, and

- messages.
 Logs of applications and APIs are not monitored for suspicious activity.
- Logs are only **stored locally**.
- **Appropriate alerting** thresholds and response escalation processes are not in place or effective.
- Penetration testing and scans by dynamic application security testing (DAST) tools (such as OWASP ZAP) do not trigger alerts.
 - The application **cannot detect**, escalate, or alert for active **attacks** in real-time or near real-time.

- 1. Time stamp from a trusted system component
- 2. Severity rating for each event
- 3. Tagging of security relevant events, if they are mixed with other log entries
- 4. Identity of the account/user that caused the event
- 5. Source IP address associated with the request
- 6. Event outcome (success or failure)
- 7. Description of the event
